vampires occur in the West Indies. An interesting chapter is devoted to the habits of the rare *Papilio homerus* of Jamaica.

On the whole, the book will probably serve its purpose, viz., to stimulate young people to an active, wholesome interest in the field work of natural history.

L'Amateur de des Papillons.⁴—This handy volume is one of the series, *Bibliothèque des Connaissances utiles*, contributed by M. H. Coupin, and is intended for the use of amateur butterfly collectors. After a brief discussion of the organization and life-history of this order of insects, in the course of which is given a concise account of "mimicry," polymorphism and parthenogenesis, the author comes at once to the main idea of the work, namely, advice to the amateur collector. Descriptions of articles included in a good outfit for collecting and preserving material are followed by advice as to where and how to find different species, not only of the adult but of the chrysalid, caterpillar and egg. Finally, a chapter on mounting and displaying the collection completes this admirable book of instruction.

The book is profusely illustrated, a matter of considerable importance where the text is necessarily so concise.

Monographic Revision of the Pocket Gophers.⁵—This work is one of the North American Fauna Series, published by the U. S. Dept. of Agriculture. It has been prepared by Dr. Merriam after a critical study of over a thousand specimens, including many types, and constitutes a monograph of the family Geomyidae, exclusive of the genus *Thomomys*. The systematic descriptions of the genera and species are prefaced with a discussion of the morphology of the skull, and a description of some remarkable dental peculiarities as to the distribution of the enamel discovered by the author during his investigation. The opening chapter contains an interesting account of the habits and distribution of these animals, variation, both sexual and individual, and a key to the genera.

The book is well illustrated with 20 full-page plates, 71 text figures and 4 maps, 3 of which show the distribution of the different genera, and one gives the distribution of the species of *Geomys* and *Cratogeomys*.
